

## **Instructions to run:**

- To run the search function, fork the source code provided in you vsCode or IDE.
- Start the backend by typing: `cd server` and then `npm run server` in the terminal. (nodemon connected)
- Start the frontend by typing: `cd client` and then `npm run dev`. The client is built on vite-react, so open the link come to the terminal on writing run command.
- Select or deselect youtube/articles checkboxes as per preference and search for anything.

## **Challenges faced:**

- I couldn't find Google Scholar API anywhere to integrate research and academic papers on search.
- I faced difficulties in arranging the items based on likes or views (couldn't find those props )
